laserdata

Prepared for **WebEngage**

Real-time Contextual Journey trips for WebEngage, on LaserData.

Every tracked event reaches the worker that holds its user's trips, in order and in milliseconds, so **a Policy Renewed exit cancels that policy's reminder**. It runs beside your event pipeline, so nothing else has to move.

One user, two policies, one reminder,
as the event log sees it.
Now multiply by 1.6T events a year.

Tue 09:00:00.000	Renewal Due ×2	u000418230 · POL-1042, POL-2210 · partition 9
Wed 08:59:59.880	Policy Renewed	u000418230 · policy_id POL-1042 · seq 41
Wed 08:59:59.889	trip.exit	journey-1 · POL-1042 · +9 ms · reminder cancelled
Wed 09:00:00.004	reminder.sent	journey-1 · POL-2210 · renewal_reminder
Wed 09:00:03.004	send.audit	0 reminders after exit · 0 trips reminded twice

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Contextual Journeys: **"User + Context = Unique Journey Trip"**, several trips per user at once, each with a context-bound Wait for Event and Exit Trigger, such as Policy Renewed for the same policy (WebEngage blog, Dec 2025). 1.6T+ events tracked a year.
Where it fits	**The trip lane:** tracked events keyed by user. Each worker owns its partitions and every trip of their users, so an exit is applied in order, before the reminder timer reads the trip. Your pipeline keeps everything else.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for WebEngage: **tracked events keyed by user**, journey workers that hold every trip (user + context) and fire its reminder, a send-side audit for reminders after exit, a campaign send next door, and a Kafka shadow bridge for /events-shaped records. It prints p99 and reminders after exit every second.

Open the WebEngage kit and write-up →

Then a 2–4 week evaluation on mirrored events for a set of Contextual Journeys, beside your pipeline, priced per billion events. **No advantage, no migration.**
