laserdata

Prepared for **FanCode**

Live scorecards on every node for FanCode, on LaserData.

Every score update reaches **every scorecard node in milliseconds**, and a node added for a headline match rebuilds every live scorecard from the log. It runs beside Kafka and Memorystore, so nothing else has to move.

One ball, one poll, one node added,
as the event log sees it.
Now multiply by every live match.

20:41:07.300	score.update	IND v AFG · 17.3 · SIX · 168/4 · key 418
20:41:07.303	node.applied	node-1 … node-12 · +3 ms · key 418 answerable
20:41:08.050	node.rebuilt	node-13 · 40 of 40 live matches from the log
20:41:09.120	poll.answered	lastKey 417 → refresh · key 418 · next poll in 5 s

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**"Real-time data processing powers interactive features like live scores"** for 160M+ users and 15,000+ live events a year (Google Cloud blog, 2024); 6M concurrent viewers in one series (AWS, 2022). The web app polls scorecardPoll every 5 s.
Where it fits	**The live scorecard lane:** every update keyed by match with its scorecardPoll key, read by every node with its own offsets, kept for the match day. Kafka, Memorystore and the GraphQL API stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for FanCode: **40 live matches across six sports**, nodes answering for 6 million viewers polling every 5 s, a 4× match-start surge next door, a node added mid-match and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the FanCode kit and write-up →

Then a 2–4 week evaluation on one mirrored score topic, beside Kafka. **No advantage, no migration.**
