laserdata

Prepared for **Expedia Group**

Real-time AdaptEx decisions for Expedia Group, on LaserData.

Every arm a Sampler shows a traveler reaches **every Sampler's consistency cache in milliseconds**, so the hero image stays the same on the next page, whichever pod serves it. It runs beside Kafka, so nothing else has to move.

One traveler, one property, two pages,
as the event log sees it.
Now multiply by every session.

20:14:03.180	bandit.decision	S0381172	H104217 · image 4 · pod A
20:14:03.186	sampler.cache	S0381172	applied on every pod
20:14:03.610	page.request	S0381172	property H104217 · to pod C
20:14:03.612	pod C: decision found · image 4 kept, no new draw		

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**AdaptEx Samplers scale out horizontally** and keep a consistency cache, so a traveler's experience stays the same across a session. Each decision is a "bandit proposed action" event on Kafka. (RecSys 2023; Kafka Summit 2021)
Where it fits	**The bandit decision lane:** session, bandit and arm shown, keyed by session, read by every Sampler pod. Kafka, Flink, Spark and the Bandit Store stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Expedia Group: **50,000 properties with a hero-image bandit**, Sampler pods behind a load balancer with no stickiness, travelers who search, re-sort and open properties, a traffic spike, a clickstream neighbour and a shadow bridge. It prints your lane's p99 and flipped images on revisits, every second.

Open the Expedia Group kit and write-up →

Then a 2–4 week evaluation on one mirrored decision stream, beside AdaptEx. **No advantage, no migration.**
