laserdata

Prepared for **Lyft**

Real-time demand forecasts for Lyft pricing, on LaserData.

Every forecast frame, for every geohash, reaches **Rider Pricing and Driver Earnings complete in milliseconds**, even on a faster pricing loop. It runs beside MSK and Flink, so nothing else has to move.

One geohash in San Francisco,
as the event log sees it.
Now multiply by 4M geohashes a minute.

```
22:41:05.000   forecast.sealed     SF   frame 4,812    9q8yyk demand 3.1 → 9.4 per 5 min
22:41:05.009   rider-pricing       SF   frame 4,812 ready: all 1,000 cells, concert spike in
22:41:05.011   driver-earnings     SF   9q8yyk bonus zone on
22:41:05.400   ride.quote          SF   9q8yyk priced on frame 4,812
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**"Our spatial temporal forecasting models predict forecast values for 4M geohashes per minute, per signal,"** synced to a Kafka topic that Rider Pricing and Driver Earnings read in real time. Next: "faster feedback loops for marketplace pricing." (Lyft Engineering, May 2025, Aug 2026)
Where it fits	**The geohash forecast lane:** each region's frame of demand and supply forecasts, keyed by region, read by Rider Pricing, Driver Earnings and the supply heatmaps. MSK, Flink and the Feature Store stay.
Next	**AI agents** for marketplace operations and support read the same live forecasts, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Lyft: **300 regions × 400 geohash-6 cells in a frame every 5 s**, Rider Pricing and Driver Earnings readers (one restarted, as a deploy would), a concert spike, an analytics-events flood and an MSK shadow bridge. It prints each reader's p99, frame-ready time and quotes priced on a superseded forecast next to a copy polled every second.

Open the Lyft kit and write-up →

Then a 2–4 week evaluation on one mirrored forecast topic, beside MSK. **No advantage, no migration.**
