laserdata

Prepared for **project44**

Real-time carrier position sharing for project44, on LaserData.

Every truck position reaches **the customer whose shipment is on board, in milliseconds, and never after the share ends**. It runs beside Kafka, so nothing else has to move.

One truck, one shipment,
as the event log sees it.
Now multiply by every fleet.

14:02:08.904	vehicle.position	TRK-0418273 · 41.5921, -87.3464 · to CUST-00207 · +5 ms
14:02:11.420	shipment.stop	SH4471902216 off TRK-0418273 · carrier stopped sharing
14:02:14.512	vehicle.position	TRK-0418273 · 41.5874, -87.3018
14:02:14.516	share.withheld	no open shipment on this truck · +4 ms

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Positions reach your tracking systems through Kafka**, on Strimzi, with a mandate to cut cloud spend. A customer sees a truck only from the 50 km pick-up geofence until it leaves the delivery geofence. (TechBlog; help centre; job posts)
Where it fits	**The position share lane:** positions and shipment changes keyed by vehicle into the share gate, updates out to customers. Kafka keeps the rest.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for project44: **100,000 connected trucks**, your geofence rule, stops mid-route, a 72-hour replay next door and a Kafka shadow bridge. It prints p99 and any leak, every second.

Open the project44 kit and write-up →

Then a 2–4 week evaluation on one mirrored position topic, alongside Kafka. **No advantage, no migration.**
