laserdata

Prepared for **PayPal**

Real-time account links for PayPal's risk graph, on LaserData.

Every login's device and IP, and every profile asset an account adds, reach the real-time graph **in milliseconds, so the two-hop check on that account's next payment already sees the link**. It runs beside Kafka, so nothing else has to move.

One new account, one known-bad asset,
a payment 610 ms later, as the event log sees it.
Now multiply by thousands of payments a second.

```
14:22:07.180   login                new account N0041977320 · new device, IP linked
14:22:07.410   profile.asset_added  VID 9f3c…e1 · shared by 7 restricted accounts
14:22:07.421   graph.link           account → VID edge applied · +11 ms
14:22:08.020   payment.check        account → VID → 7 restricted accounts → hold
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Almost all PayPal risk models use graph features.** Two-hop queries take 10 ms on average, while the graph's write path, fed by login and transaction events, aims for "seconds level data freshness". (PayPal Technology Blog, 2021)
Where it fits	**The graph link lane:** each login's and profile change's account-to-asset links, keyed by asset, into the graph's write path. In shadow first; Kafka, the graph store and risk decisioning stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for PayPal: **5,000 logins a second with a 3× peak**, repeat fraudsters re-adding known-bad assets, a two-hop check on the next payment, a tracking stream next door and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the PayPal kit and write-up →

Then a 2–4 week evaluation on one mirrored login-events topic, self-hosted beside your Kafka. **No advantage, no migration.**
