laserdata

Prepared for **Spotify**

Real-time episode publish status for Spotify, on LaserData.

Every upload's receipt and stage change reaches **the status service in milliseconds**, so creators see "received and queued" at once and a backlog pages in a second. It runs beside Pub/Sub, so nothing else has to move.

One video episode in a backlog,
as the event log sees it.
Now multiply by a bulk delivery.

```
15:02:10.400   received   show-104233:9f3c2a71  new · 4,210 ahead
15:02:10.406   status     "received and queued" for the creator  +6 ms
15:07:10.470   alert      oldest new episode waited 5:00  +70 ms
15:14:31.025   re-upload  "already received, queued since 15:02"
```

From the creators of Apache Iggy

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	On June 24, **video transcoding hit maximum capacity** and episodes that normally publish within minutes waited hours. "The system should have confirmed their upload was **received and queued**, and it did not" (Spotify Engineering, 2026).
Where it fits	**The episode status lane:** every upload's receipt and stage change, keyed by episode, into the status service, with the oldest wait per priority queue. Transcoding, queues and Pub/Sub stay.
Next	**AI agents** act on the same lane, such as drafting the creator notice while a backlog builds, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Spotify: **new uploads and updates into a transcoding pool, a 3.5× bulk delivery**, creator re-uploads, repeated events, the reprocessing log next door, a replica started mid-backlog and a Pub/Sub shadow bridge. It prints the lane's p99 every second and how fast each backlog alert fired.

Open the Spotify kit and write-up →

Then a 2–4 week evaluation on a mirror of your episode stage changes, alongside your current pipeline. **No advantage, no migration.**
