laserdata

Prepared for **Tubi**

Creative readiness for the Tubi ad server, on LaserData.

Every new creative reaches **the creative registry once, and its verdict reaches every ad server node in milliseconds**, even at kickoff. It runs beside your ad server, so nothing else has to move.

One new creative at kickoff,
as the event log sees it.
Now multiply by every flight.

```
19:58:02.140   creative.seen    cr-0481233  as-03  dsp-07  → one job started  +6 ms
19:58:02.910   creative.seen    cr-0481233  as-05, as-11  absorbed, no second job
19:58:09.905   creative.ready   cr-0481233  auto · brand-0412  on 8/8 nodes  +5 ms
19:58:12.400   ad.decision     as-06  bid $24.10 → placed, one auto ad in the pod
```

From the creators of Apache Iggy

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Your in-house ad server fills **pods of 1–5 slots in under a second**, transcodes every new creative and **identifies the brand of programmatic ads** for reporting, frequency caps and competitive separation, now with an LLM pipeline. (Tubi Engineering, 2020 and 2026)
Where it fits	**The creative readiness lane:** sightings keyed by creative into the registry, one job per creative, verdicts out to every ad server node. Transcoding, brand recognition and your data stack stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Tubi: **8 ad server nodes, 5,000 ad requests/s, 6,000 creatives in rotation**, new flights in waves, a creative registry, an ad event log next door and a Kafka shadow bridge. It prints both hops' p99, jobs against repeat sightings, and pod fill and RPM against a slower refresh, every second.

Open the Tubi kit and write-up →

Then a 2–4 week evaluation on one mirrored bid-log topic, beside your ad server. **No advantage, no migration.**
