laserdata

Prepared for **Netcore Cloud**

Real-time delivery status for Netcore Cloud, on LaserData.

Sent, Delivered and Read webhooks each get their own Apache Iggy topic, so Delivered counts reach campaign reports **in milliseconds, even during a Read surge**. It runs beside your Pub/Sub topics, so nothing else moves.

One Delivered webhook during a Read surge,
as the event log sees it.
Now multiply by 10,000 a second.

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**~665M messages in 4 days**, 10K+ status webhooks a second (20K+ in tests), one stream per status type: a backlog in Read "has zero impact on the processing of Delivered events". (Netcore engineering blog)
Where it fits	**The delivery status lane:** Sent, Delivered and Read on their own topics, keyed by message ID. Delivered gets its own writer; Read waits at its write cap. Your senders and reports stay as they are.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Netcore Cloud: **a webhook receiver at ~10K status webhooks a second**, three status topics, an uncapped Delivered writer, a capped Read writer, a Read surge, and a Pub/Sub or Kafka shadow bridge. It prints Delivered p99 every second.

Open the Netcore Cloud kit and write-up →

Then a 2–4 week evaluation on mirrored status webhooks for a set of campaigns beside Pub/Sub, priced per billion webhooks. **No advantage, no migration.**
