laserdata

Prepared for **Jump Trading**

Real-time link health alerts for Jump Trading, on LaserData.

Every RSSI, SNR and BER sample reaches **the alert rules, and every alert reaches the network console, in milliseconds**, while the link is still degraded. It runs beside Redpanda, off the trading path.

One link, one short fade,
as the event log sees it.
Now multiply by every link.

```
14:07:07.432   link.sample     mw-0142  seq 88213  SNR 19.5 dB  BER 4.1e-5
14:07:07.439   link.alert      mw-0142  link_degraded  baseline 36.8 dB  +7 ms
14:07:07.442   alert delivered  console, on-call, status board  +3 ms
14:07:07.632   link.alert      mw-0142  link_recovered  5 clean samples  +200 ms
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Telemetry and log files** are your primary streaming use cases: system measurements and market information from **tens of thousands of nodes**, on Redpanda at p99 150 ms. Your network team **baselines link RSSI, SNR and BER** and alerts on it. (Jump CTO on Redpanda's blog, 2023; Jump job post, 2026)
Where it fits	**The link health alert lane:** samples keyed by link into the baseline and alert rules, alerts out to the console, on-call and status board. Redpanda and the trading path stay as they are.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy, in Rust with no JVM.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Jump Trading: **1,000 links, a sample every 20 ms each**, per-link baselines, a storm of fades, a slow consumer and log shipping next door, and a Redpanda shadow bridge. It prints your lane's p99 and the alerts that reached the console while the link was still degraded, every second.

Open the Jump Trading kit and write-up →

Then a 2–4 week evaluation on one mirrored link telemetry topic, alongside Redpanda. **No advantage, no migration.**
