laserdata

Prepared for **Netflix**

Real-time frequency caps for Netflix ads, on LaserData.

Every ad impression reaches **every ad server's frequency-cap view in milliseconds, before that profile's next ad decision**, even in a live ad break. It runs beside Kafka and Flink, so nothing else has to move.

One profile in a live ad break,
two ad servers, one sponsor cap.
Now multiply by every viewer.

```
20:41:10.412   impression   pf-04188331   spn-04   slot 1 · ads-07   count 1/1
20:41:10.418   applied      in every ad server's cap view   +6 ms
20:41:10.912   ad request   pf-04188331   slot 2 · ads-12
20:41:10.913   cap held     spn-04 skipped, slot filled with spn-09
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Frequency capping **"needs events under a strict SLA"** and cannot take late ones. One live ad break is **hundreds of thousands of ad events a second** in one region, on Kafka and Flink. (Netflix TechBlog, 2026)
Where it fits	**The frequency-cap lane:** every impression, keyed by profile, to every ad server's cap view, counted once by event ID. Kafka, Flink and the Data Mesh stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Netflix: **3 ad servers, 200,000 profiles, a live ad break every 30 s** split across servers, repeated events, playback beacons next door, a restart and a Kafka shadow bridge. It prints the lane's p99 every second and over-cap impressions every window.

Open the Netflix kit and write-up →

Then a 2–4 week evaluation on a mirror of your enriched impressions, alongside Kafka. **No advantage, no migration.**
