laserdata

Prepared for **Gupshup**

Real-time wallet balances for Gupshup, on LaserData.

Every message's fees reach **the app's wallet, and every 1003 block reaches every send node, in milliseconds**, even at campaign peak. It runs beside your billing pipeline, so nothing else has to move.

One app at its overdraft limit,
as the event log sees it.
Now multiply by every app running a campaign.

```
19:30:07.391   charge.delivered   app-01742   send-02   Meta fee   −$19.990
19:30:07.412   charge.accept      app-01742   send-05   Gupshup fee   −$20.002
19:30:07.415   wallet.state       app-01742   BLOCKED   +3 ms
19:30:07.418   block applied      8/8 send nodes, the next send gets 1003   +3 ms
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Prepaid wallets: **the Gupshup fee and the WhatsApp fee are deducted per message**, the Meta fee on delivered or read events. An overdraft limit from past usage; **1003 "Wallet Balance Low"** stops sends. Meta bills service messages from 1 Oct 2026. (Gupshup partner docs, 2024–2026)
Where it fits	**The charges lane:** fees keyed by app into the wallet; low, blocked and recharged back to every send node. Invoices, usage reports and the partner portal stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Gupshup: **8 send API nodes, 5,000 apps, 4,000 messages/s**, a wallet service with overdraft limits, low-balance alerts, 1003 blocks and top-ups, a campaign spike, an inbound-messages flood next door and a Kafka shadow bridge for billing events. It prints your lane's p99 and messages accepted past the overdraft every second.

Open the Gupshup kit and write-up →

Then a 2–4 week evaluation on mirrored billing events for a set of apps, beside your current pipeline. **No advantage, no migration.**
