laserdata

Prepared for eBay

Real-time broadcast notifications for eBay, on LaserData.

Each broadcast is split into windows of 200 and **pushed to all 20,000 subscriptions in tens of milliseconds**, with unicast notifications never queued behind it. It runs beside ESP's Kafka, so nothing else has to move.

One broadcast, one endpoint that is down,
as the event log sees it.
Now multiply by every topic.

```
14:32:07.000   event  MARKETPLACE_ACCOUNT_DELETION  broadcast  20,000 subscriptions
14:32:07.002   split  100 windows of 200  window w to partition w % 16  +2 ms
14:32:07.045   pushed  all 100 windows  19,937 acknowledged  +45 ms
14:32:07.045   no ack  sub-0004817  held on push-retry, the window carries on
14:32:10.140   acknowledged after retry  sub-0004817  +3.1 s
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	ESP pushes **bid status, shipment and feed events** to partners and sellers in real time. A broadcast to **20,000 subscribers** held the event thread, so it became **windows of 200** with task affinity. Kafka pipelines. (eBay tech blog, 2022; ESP job posts, 2026)
Where it fits	**The broadcast push lane:** each window on the partition of the push worker that caches it, unicast on its own topic, unacknowledged pushes on a retry topic. ESP and Kafka stay.
Next	**Seller and partner topics** on the same lane, with receipts that answer "was it sent?" when a partner asks.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for eBay: **4 push workers, a broadcast to 20,000 subscriptions in 100 windows**, 3,000 unicast notifications a second, planted endpoint outages with a retry worker, and a Kafka shadow bridge. It prints the lane's p99 and each broadcast's time to its last subscription.

Open the eBay kit and write-up →

Then a 2–4 week evaluation on one mirrored business-event topic, alongside ESP's Kafka. **No advantage, no migration.**
