laserdata

Prepared for **Klaviyo**

Failed-writes capture for Klaviyo's event pipeline, on LaserData.

Every event whose MSK publish fails lands on Apache Iggy in milliseconds and is re-published inside its SLO, **even when half of all publishes fail**. Only the failed-writes cluster changes, so MSK stays as it is.

A checkout event fails, and still makes its 5 s SLO,
as the event log sees it.
Now multiply by a BFCM surge.

20:10:00.000	msk.timeouts	main topics · half of all publishes failing
20:14:03.112	publish.failed	Started Checkout · profile pf004182307 · P10
20:14:03.114	captured	failed-writes · partition 5 · seq 88,412 · ack 2 ms
20:14:03.121	retry.failed	retrier-1 · attempt 1 · back on failed-writes
20:14:03.229	re-published	P10 topic on MSK · +117 ms · SLO 5 s

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**170,000 events/s at peak on MSK,** with SLOs from 5 s (real-time notifications) to 20 min. A publish that fails goes to a failed-writes topic on a separate self-hosted Kafka cluster, then a DLQ kept 7 days (Klaviyo Engineering, 2025).
Where it fits	**The failed-writes lane:** Apache Iggy as that separate cluster, with failed-writes and DLQ topics keyed by profile. Retriers read partitions directly and re-publish to MSK. MSK, the proxy and the processors stay as they are.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Klaviyo: **a publisher with MSK timeouts and a 50% surge**, failed-writes and DLQ topics on Apache Iggy, sharded retriers with backoff, a bulk S3 replay next door, and a Kafka shadow bridge. It prints capture-to-retry p99, on-time rate per lane and events lost every second.

Open the Klaviyo kit and write-up →

Then a 2–4 week evaluation on mirrored failed writes and a rehearsed surge beside MSK, priced per billion events. **No advantage, no migration.**
