laserdata

Prepared for **PubMatic**

Real-time household frequency caps for PubMatic CTV, on LaserData.

Every CTV impression reaches **every ad server in milliseconds, before that household's next ad request**, even in a live-sports break. It runs beside Kafka, so nothing else has to move.

One household in a live game,
two screens, one cap.
Now multiply by every household.

```
20:41:12.408   exposure     hh-0418833  cmp-007  TV · ad-07  count 3/3
20:41:12.414   applied      on every ad server  +6 ms
20:41:12.910   ad request   hh-0418833  phone · ad-12
20:41:12.911   cap held     cmp-007 skipped, slot filled with cmp-019
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Your CTV ad server runs at **1 trillion+ requests a day, millions a second**, and your engineers build household-level frequency capping. Data runs on Kafka and Spark Streaming. (PubMatic job posts, 2026)
Where it fits	**The household lane:** every impression, keyed by household, to every ad server before the next ad decision. Kafka, Spark and Snowflake stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for PubMatic: **3 CTV ad servers, 200,000 households, 5,000 ad slots/s each**, a live-sports break, a log-level flood next door, a restart and a Kafka shadow bridge. It prints your lane's p99 every second and over-cap impressions every window.

Open the PubMatic kit and write-up →

Then a 2–4 week evaluation on one mirrored impression topic, alongside Kafka. **No advantage, no migration.**
